SUMMARY

Backend engineer with 5+ years in statically typed languages, and author of an open-source **async Rust** database driver. My day job at Amazon is a **tax-rules engine** and catalog services in a nearly 1M-line distributed Java codebase, where a subtly wrong number is a real fiscal-compliance problem. I read more code than I write, and I am on call for what I ship.

EXPERIENCE

Software Development Engineer

Nov 2025 — Present

Amazon

Remote · Brazil

- Build and maintain a **tax-rules engine** plus catalog and lot-management services: 25+ production changes across 6+ services in a nearly 1M-line distributed **Java** codebase, where fiscal correctness is the requirement, not a feature.
- **Investigate and fix bugs in critical production flows** as on-call DRI: root-caused a vendor-code misclassification that left 50,809 units unsellable, then shipped the fix plus the detection alarms preventing recurrence.
- Work daily in **code I did not write**: reading, reviewing and safely changing unfamiliar services, tracing cross-service failures via **distributed tracing, metrics and audit APIs**.
- Invented and shipped **DockyardGreasemonkey**, an AI-assisted root-cause tool now used across the whole team (12+ engineers).

Software Engineer & Technical Lead

Jun 2022 — Oct 2025

Smart BR Soluções Tecnológicas

Remote · Brazil

- As Technical Lead on a marketplace integration, reconciled complex **ERP, fiscal and relational-database constraints** against business requirements, working directly with non-engineering stakeholders.
- Architected an **event-driven** search platform: a real-time Elasticsearch index fed by **Apache NiFi change-data-capture pipelines**, keeping a derived store correct and correctly ordered against its source of truth.
- Led migration of a high-traffic e-commerce API from Java 8/11 to Java 22 under live traffic; moved infrastructure from Docker Swarm toward **Kubernetes** with zero-downtime CI/CD.

Software Developer

2019 — 2022

Loupen internship, freelance & hackathon projects · full-stack web with ReactJS and Node.js

Brazil

OPEN SOURCE (RUST)

Author & Maintainer, ScyllaDB JavaScript Driver (async Rust) (github.com/daniel-boll/scylla-javascript-driver) 2024 — Present

- Authored a driver exposing a **safe, fast async API** in Rust over native Node-API bindings, with external users depending on it.
- Wraps the official ScyllaDB Rust driver: works against **database wire protocols** and query internals, handling **FFI memory safety** across the Rust/JS boundary.

Core Team Member, ExpressoTS (Open Source)

2023 — 2024

- Core contributor to a TypeScript backend framework; built native **C++ modules via the Node-API addon interface**.

SKILLS

- **Languages:** Rust, Java, TypeScript, C/C++, JavaScript, Python, Go
- **Rust:** async Rust, Node-API / FFI bindings, memory safety, native addons, compilers, wire protocols
- **Data & Messaging:** SQL & relational schema design, query optimization, **Kafka**, change-data-capture, Elasticsearch
- **Infra & Domain:** Docker, **Kubernetes**, CI/CD, AWS, distributed tracing, metrics, on-call · Brazilian fiscal/tax rules, ERP integration, transactional correctness

EDUCATION

Western Paraná State University (UNIOESTE)

Cascavel, Brazil

B.S. in Computer Science

2019 — 2024

- Thesis: an educational **compiler written in Rust** lowering a TAC IR to MIPS assembly.
