SUMMARY

Software engineer with 5+ years across the stack, from distributed backend services and infrastructure to frontend and developer tooling. I design and ship features end-to-end, debug complex production systems, and collaborate closely across teams. Open-source contributor in Rust and TypeScript, and a daily user of AI-assisted development.

EXPERIENCE

Software Development Engineer Nov 2025 — Present
Amazon *Remote · Brazil*

- Invented and shipped **DockyardGreasemonkey**, an AI-assisted root-cause tool that ranks likely causes from full ticket context; adopted across the whole team (12+ engineers) and drawing cross-team interest, with an org-wide presentation now being prepared.
- Drove end-to-end resolution of a production incident that left 50,809 units unsellable; root-caused a vendor-code misclassification in a distributed inbound-inventory pipeline and shipped the detection alarms and fix that closed it.
- Delivered 25+ production changes across 6+ services (catalog, tax-rules engine, lot management), closing 30+ tracked work items over two quarters in a nearly 1M-line distributed Java codebase.
- Routinely root-cause subtle cross-service failures (entity build-ordering bugs, transitive dependency build breaks, auth-chain misconfigurations) using distributed tracing and audit APIs.

Software Engineer & Technical Lead Jun 2022 — Oct 2025
Smart BR Soluções Tecnológicas *Remote · Brazil*

- Led migration of a high-traffic e-commerce API from Java 8/11 to Java 22 and re-architected search around a real-time Elasticsearch index fed by Apache NiFi change-data pipelines.
- Ran a phased Next.js 11 to 13 frontend migration behind Nginx, built a shared Design System (Shadcn UI), and moved infrastructure from Docker Swarm toward Kubernetes with zero-downtime CI/CD.
- As Technical Lead, set technical direction for a marketplace integration, reconciling complex ERP and database constraints with business goals and onboarding the team through knowledge-transfer sessions.

Software Developer 2019 — 2022
Loupén internship, freelance & hackathon projects · full-stack web with ReactJS and Node.js *Brazil*

PROJECTS

Author, ScyllaDB JavaScript Driver (Rust) (github.com/daniel-boll/scylla-javascript-driver) 2024 — Present

- Authored an open-source ScyllaDB driver for Node.js in Rust: a safe, fast async API over native Node-API bindings.
- Wraps the official Rust driver, handling FFI memory safety and data marshaling across the Rust/JavaScript boundary.

Core Team Member, ExpressoTS (Open Source) 2023 — 2024

- Core contributor to ExpressoTS, a TypeScript backend framework; improved the CLI developer experience and built native C++ modules via the Node-API addon interface.

SKILLS

- Languages:** TypeScript, Java, Rust, JavaScript, C/C++, Python, Go
- Frontend:** React, Next.js, Tailwind CSS, Shadcn UI
- Backend, Data & Infra:** Node.js, ScyllaDB, Elasticsearch, Kafka, SQL, Docker, Kubernetes, CI/CD, AWS
- Spoken:** Portuguese (native), English (fluent)

EDUCATION

Western Paraná State University (UNIOESTE) Cascavel, Brazil
B.S. in Computer Science 2019 — 2024

- Thesis: an educational compiler in Rust that lowers a TAC intermediate representation to MIPS assembly, with a companion VM interpreter.
- Scientific research on species-distribution modeling, accelerated via C++ parallelization (PET program).
